The 75th Report on

FOOD PRODUCTS

J. GORDON HANNA 1970

John J. Hayes, of the staff in Analytical Chemistry, prepares a meat sample for examination.
This Station has analyzed foods offered for sale in this State since 1896. The resulting impartial analytical information is made available in bulletins published annually to help the Connecticut consumers choose more intelligently among the suppliers of food and protect themselves from fraud, adulterations and deceptions.

The arrangement of this bulletin is an alphabetical listing of Connecticut towns and dealers from which samples have been collected. This arrangement is intended to make information readily available to help the reader assess the relative reliability of suppliers in his area. The analyses made by Station chemists are shown and deficiencies, if any, are noted. The data in the bulletin are also useful in comparing the qualities of different brands of the same product.

The total number of samples analyzed in the previous seven years and the number of such samples found deficient in one or more ways are tabulated for each dealer sampled in the year covered by this report. The reader should understand that many of the food samples were collected because they were already suspect, either by inspectors or by consumers. Therefore, the ratio of number of deficiencies found relative to the total number of samples examined is higher than that expected from purely random sampling.

The official samples reported in this bulletin were collected by inspectors of the Department of Consumer Protection and of the Department of Agriculture and Natural Resources. Authority for prosecution of violators and for the inspection of food establishments and dairies is given to the Commissioners of these Departments. The station makes no prosecution of dealers. Throughout the year, results are made immediately available to the Commissioners to aid them in enforcement.

In addition to the samples listed, the Commissioner of Agriculture and Natural Resources submitted 457 samples of the Connecticut milk supply for chlorinated pesticide residue analyses.

Evaluations of the significance of the pesticide residues found in milk and other food and reported in this bulletin are based on official tolerance levels established by the Food and Drug Administration of the U.S. Department of Health, Education and Welfare. In most cases these tolerance levels include a 100-fold safety factor based on the physiological effects on test animals.
Analyses for adulteration or for conformance to label claims were in many cases the bases for deciding whether or not samples were deficient. In other cases examinations of products for conformance to State and Federal definitions and standards of identity were used. Some of the latter requirements may be of interest relative to the interpretation of the data listed in this bulletin.

Frankfurts and bologna are limited to not more than 3.5 per cent fillers, 10 per cent added water, and 200 parts per million sodium nitrite. Hamburg must not contain more than 30 per cent fat, and pork sausage not more than 50 per cent fat. The addition of sulfur dioxide to any meat product is prohibited.

Vitamin D Milk is standardized to contain 400 USP units of vitamin D per quart. Vitamin-mineral fortified milk is required to contain not less than the following quantities of vitamins: vitamin A, 4,000 and vitamin D, 400 USP units per quart; thiamine, 1; riboflavin, 2; and niacin, 10 milligrams per quart.

The work represented by this report was performed by Messrs. Botsford, Glowa, Hankin, Keirstead, Smith, Squires, West, Wickroski, Miss Hornig, and Mrs. Barger, McLean and Rogers.
